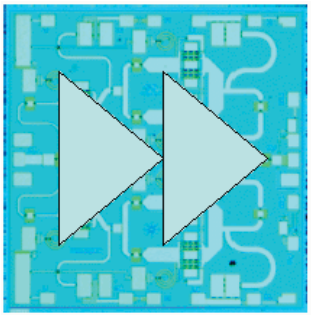
AMMC-6408
6-18 GHz 1W Power Amplifier

Data Sheet

Lead (Pb) Free
RoHS 6 fully
compliant



Chip Size: 2000 x 2000 µm (78.5 x 78.5 mils)
Chip Size Tolerance: ± 10 µm (±0.4 mils)
Chip Thickness: 100 ± 10 µm (4 ± 0.4 mils)
Pad Dimensions: 100 x 100 µm (4 ± 0.4 mils)

Description

The AMMC-6408 MMIC is a broadband 1W power amplifier in a surface mount package designed for use in transmitters that operate in various frequency bands between 6GHz and 18GHz. At 8GHz, it provides 29 dBm of output power (P-1dB) and 20dB of small-signal gain from a small easy-to-use device. This MMIC is optimized for linear operation with an output third order intercept point (OIP3) of 38dBm.

Applications

- Microwave Radio systems
- Satellite VSAT, DBS Up/Down Link
- LMDS & Pt-Pt mmW Long Haul
- Broadband Wireless Access (including 802.16 and 802.20 WiMax)
- WLL and MMDS loops

Features

- Wide Frequency Range 6-18GHz
- Highly linear: OIP3=38dBm
- Integrated RF power detector
- ESD protection (40V MM, and 200V HBM)
- Input port partially matched (For narrowband applications, customer may obtain optimum matching and gain with an additional matching circuit)
- Specifications (Vdd=5V, Idq=650mA)
- Frequency range 6 to 18 GHz
- Small signal Gain of 18dB
- Return loss: Input: -3 dB, Output: -9 dB
- High Power: @ 8 GHz, P-1dB = 29 dBm

Attention: Observe Precautions for handling electrostatic sensitive devices.
ESD Machine Model (Class A)
ESD Human Body Model (Class0)
Refer to Avago Application Note A0040R:
Electro Discharge Damage and Control.
Note: This MMIC uses depletion mode pHEMT devices. Negative supply is used for the DC gate biasing.

Absolute Maximum Ratings

Symbols	Parameters	Units	Minimum	Maximum	Notes
Vd-Vg	Drain to Gate Voltage	V		8	
Vd	Positive Supply Voltage	V		5.5	
Vg	Gate Supply Voltage	V	-2.5	0.5	
Id	Drain Current	mA		TBD	2
PD	Power Dissipation	W		3.5	2 and 3
Pin	CW Input Power	dBm		20	2
Tch	Operating Channel Temp	°C		+150	4
Tstg	Storage Case Temp.	°C		-65 to +155	
Tmax	Maximum Assembly Temp (30 sec max)	°C		+320	

Notes:
1. Operation in excess of any one of these conditions may result in permanent damage to this device. Functional operation at or near these limitations will significantly reduce the lifetime of the device.
2. Dissipated power PD is in any combination of DC voltage, Drain Current, input power and power delivered to the load.
3. When operated at maximum PD with a base plate temperature of 85 °C, the median time to failure (MTTF) is significantly reduced.
4. These ratings apply to each individual FET. The operating channel temperature will directly affect the device MTTF. For maximum life, it is recommended that junction temperatures (Tj) be maintained at the lowest possible levels. See MTTF vs. Tchannel Temperature Table.

DC Specifications/ Physical Properties

Symbol	Parameters and Test Conditions	Units	Value
I_{dq}	Drain Supply Current (V_{dd}=5 V, V_g set for I_d Typical)	mA	650
V_g	Gate Supply Operating Voltage ($I_{d(Q)}$ = 650 (mA))	V	-1.1
$R_{\theta jc}$	Thermal Resistance[6] (Channel-to-Base Plate)	°C/W	22
T_{ch}	Channel Temperature	°C	150.6

Notes:
6. Channel-to-backside Thermal Resistance (θch-b) = 10°C/W at Tchannel (Tc) = 107°C as measured using infrared microscopy. Thermal Resistance at backside temperature (Tb) = 25°C calculated from measured data.

Thermal Properties

Parameter	Test Conditions	Value
Maximum Power Dissipation	Tbaseplate = 85°C	PD = 3.5W Tchannel = 150°C
Thermal Resistance (θjc)	Vd = 5V Id = 650mA PD = 3.25W Tbaseplate = 75°C	θjc = 22°C/W Tchannel = 146°C
Thermal Resistance (θjc) Under RF Drive	Vd = 5V Id = 810mA Pout = 29dBm Pd = 3.3W Tbaseplate = 85°C	θjc = 22°C/W Tchannel = 147°C

Biasing and Operation

The recommended quiescent DC bias condition for optimum efficiency, performance, and reliability is V_{dd}=5 volts with V_g set for I_{dd}=650 mA. Minor improvements in performance are possible depending on the application. The drain bias voltage range is 3 to 5V. A single DC gate supply connected to Vg will bias all gain stages. Muting can be accomplished by setting Vgg to the pinch-off voltage V_p.

A simplified schematic for the AMMC6408 MMIC die is shown in Figure 17. The MMIC die contains ESD and over voltage protection diodes for V_g, Vd1, and Vd2 terminals. In a finalized package form, Vd1 and Vd2 terminals are commonly connected to the V_{dd} terminal. The bonding diagram for the recommended assembly is shown in Figure 18. ESD diodes protect all possible ESD or over voltage damages between V_{gg} and ground, V_{gg} and V_{dd}, V_{dd} and ground. Typical ESD diode current versus diode voltage for 11-connected diodes in series is shown in Figure 19. Under the recommended DC quiescent biasing condition at V_{ds}=5V, I_{ds}=650mA, V_{gg}=-1V, typical gate terminal current is approximately 0.3mA. If an active biasing technique is selected for the AMMC6408 MMIC PA DC biasing, the active biasing circuit must have more than 10-times higher internal current that the gate terminal current.

An optional output power detector network is also provided. A typical measured detector voltage versus output power at 18GHz is shown Figure 20. The differential voltage between the Det-Ref and Det-Out pads can be correlated with the RF power emerging from the RF output port. The detected voltage is given by,

$$V = (V_{ref} - V_{det}) - V_{ofs}$$

where V_{ref} is the voltage at the DET_R port, V_{det} is a voltage at the DET_O port, V_{ofs} and is the zero-input-power offset voltage. There are three methods to calculate V_{ofs}:

1. V_{ofs} can be measured before each detector measurement (by removing or switching off the power source and measuring V_{ref} - V_{det}). This method gives an error due to temperature drift of less than 0.01dB/50°C.
2. V_{ofs} can be measured at a single reference temperature. The drift error will be less than 0.25dB.
3. V_{ofs} can either be characterized over temperature and stored in a lookup table, or it can be measured at two temperatures and a linear fit used to calculate V_{ofs} at any temperature. This method gives an error close to the method #1.

The RF ports are AC coupled at the RF input to the first stage and the RF output of the final stage. No ground wires are needed since ground connections are made with plated through-holes to the backside of the device.
