

8-BIT SINGLE-CHIP MICROCOMPUTER**DESCRIPTION**

The μPD78042A, μPD78043A, μPD78044A, and μPD78045A are 8-bit single-chip microcomputers that incorporate many hardware peripherals such as an FIP® controller/driver, 8-bit resolution A/D converter, timer, serial interface, and interrupt controller.

In addition to these standard mask ROM models, one-time PROM models that can operate in the same voltage range, EPROM models, and various development tools are being developed.

The functions of these microcomputers are described in detail in the following User's Manual. Be sure to read this manual when you design a system using any of these microcomputers.

μPD78044A Sub-Series User's Manual : IEU-1394

78K/0 Series User's Manual, Instruction : IEU-1372

FEATURES

- High-capacity ROM and RAM

Product name	Item	Program memory (ROM)	Data memory		
			Internal high-speed RAM	Buffer RAM	FIP display RAM
μPD78042A		16K bytes	512 bytes	64 bytes	48 bytes
μPD78043A		24K bytes			
μPD78044A		32K bytes	1024 bytes		
μPD78045A		40K bytes			

- Wide range of instruction execution time
 - from high-speed (0.4 μs) to ultra low-speed (122 μs)
- I/O ports: 68
- FIP controller/driver: total display outputs: 34
- 8-bit resolution A/D converter: 8 channels
- Serial interface: 2 channels
- Timer: 6 channels
- Power supply voltage: $V_{DD} = 2.7$ to 6.0 V

APPLICATIONS

VCRs, audio systems, etc.

ORDERING INFORMATION

3.1 PORT PINS (1/2)

Pin name	I/O	Function		On reset	Shared by:
P00	Input	Port 0 5-bit I/O port	Input only	Input	INTP0/TI0
P01	I/O		Can be specified for input or output in 1-bit units. When used as an input port pin, a pull-up resistor can be connected through software.	Input	INTP1
P02					INTP2
P03					INTP3/CI0
P04 ^{Note 1}	Input		Input only	Input	XT1
P10-P17	I/O	Port 1 8-bit I/O port Can be specified for input or output in 1-bit units. When used as an input port pin, a pull-up resistor can be connected through software. ^{Note 2}		Input	ANI0-ANI7
P20	I/O	Port 2 8-bit I/O port Can be specified for input or output in 1-bit units. When used as an input port pin, a pull-up resistor can be connected through software.		Input	SI1
P21					SO1
P22					$\overline{\text{SCK1}}$
P23					STB
P24					BUSY
P25					SI0/SB0
P26					SO0/SB1
P27					$\overline{\text{SCK0}}$
P30	I/O	Port 3 8-bit I/O port Can be specified for input or output in 1-bit units. Can directly drive LEDs. When used as an input port pin, a pull-up resistor can be connected through software. A pull-down resistor can be connected in 1-bit units by the mask option.		Input	TO0
P31					TO1
P32					TO2
P33					TI1
P34					TI2
P35					PCL
P36					BUZ
P37					—

Notes 1. When the P04/XT1 pins is used as an input port pin, bit 6 (FRC) of the processor clock control register must be set to 1. At this time, do not use the feedback resistor of the subsystem clock oscillator circuit.

2. When the P10/ANI0 through P17/ANI7 pins are used as the analog input lines of the A/D converter, be sure to place the port 1 in the input mode. In this case, the pull-up resistors are automatically unused.

3.1 PORT PINS (2/2)

Pin name	I/O	Function	On reset	Shared by:
P70-P74	I/O	Port 7 5-bit N-ch open-drain I/O port Can be specified for input or output in 1-bit units. Can directly drive LEDs. A pull-up resistor can be connected in 1-bit units by the mask option.	Input	—

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 PORTS

I/O ports are classified into the following 5 kinds:

- CMOS input (P00, P04) : 2
 - CMOS input/output (P01 - P03, ports 1 - 3) : 27
 - N-ch open-drain input/output (port 7) : 5
 - P-ch open-drain output (ports 8 - 10) : 18
 - P-ch open-drain input/output (ports 11 and 12) : 16
-
- Total : 68

Table 5-1 Port Function

Product	Pin	Function
Port 0	P00, P04	Input port
	P01-P03	I/O port. Can be specified for input or output in 1-bit units. When used as input port, internal pull-up resistor can be connected through software.
Port 1	P10-P17	I/O port. Can be specified for input or output in 1-bit units. When used as input port, internal pull-up resistor can be connected through software.
Port 2	P20-P27	I/O port. Can be specified for input or output in 1-bit units. When used as input port, internal pull-up resistor can be connected through software.
Port 3	P30-P37	I/O port. Can be specified for input or output in 1-bit units. When used as input port, internal pull-up resistor can be connected through software. Pull-down resistor can be connected in 1-bit units by the mask option. Can directly drive LED.
Port 7	P70-P74	N-ch open-drain I/O port. Can be specified for input or output in 1-bit units. Pull-up resistor can be connected in 1-bit units by the mask option. Can directly drive LED.
Port 8	P80, P81	P-ch open-drain high-voltage output port. Pull-down resistor can be connected in 2-bit units by the mask option (connection to V _{LOAD} or V _{SS} can be specified in 2-bit units). Can directly drive LED.
Port 9	P90-P97	P-ch open-drain high-voltage output port. Pull-down resistor can be connected in 1-bit units by the mask option (connection to V _{LOAD} or V _{SS} can be specified in 4-bit units). Can directly drive LED.
Port 10	P100-P107	P-ch open-drain high-voltage output port. Pull-down resistor can be connected in 1-bit units by the mask option (connection to V _{LOAD} or V _{SS} can be specified in 4-bit units). Can directly drive LED.
Port 11	P110-P117	P-ch open-drain high-voltage I/O port. Can be specified for input or output in 1-bit units. Pull-down resistor can be connected in 1-bit units by the mask option (connection to V _{LOAD} or V _{SS} can be specified in 4-bit units). Can directly drive LED.
Port 12	P120-P127	P-ch open-drain high-voltage I/O port. Can be specified for input or output in 1-bit units. Pull-down resistor can be connected in 1-bit units by the mask option (connection to V _{LOAD} or V _{SS} can be specified in 4-bit units). Can directly drive LED.

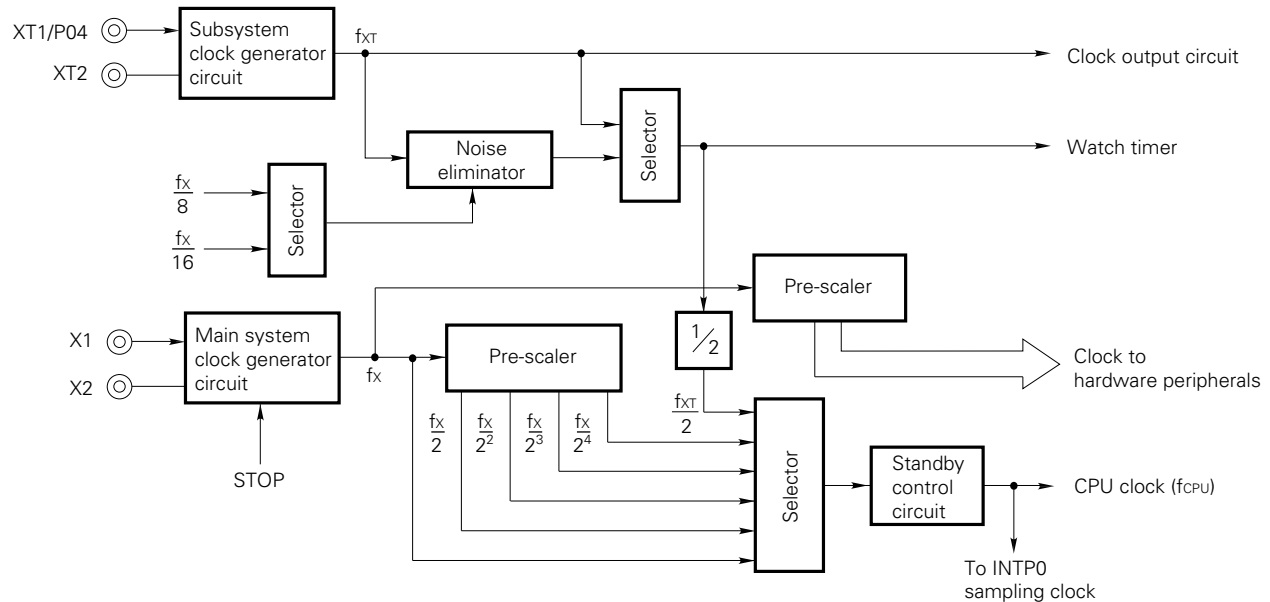

5.2 CLOCK GENERATOR CIRCUIT

The clock generator circuit has two kinds of generator circuits: the main system clock and subsystem clock. The instruction time can be changed.

- 0.4 μs/0.8 μs/1.6 μs/3.2 μs/6.4 μs (with main system clock: 5.0 MHz)
- 122 μs (with subsystem clock: 32.768 kHz)

5.3 TIMER/EVENT COUNTER

Six channels of timer/event counters are provided.

- 16-bit timer/event counter : 1 channel
- 8-bit timer/event counter : 2 channels
- Watch timer : 1 channel
- Watchdog timer : 1 channel
- 6-bit up/down counter : 1 channel

Caution When using the 6-bit up/down counter, set the CI0/P03/INTP3 pin in the input mode (set bit 3 of port mode register 0 (PM03) to 1).

5.4 CLOCK OUTPUT CONTROL CIRCUIT

Clocks of the following frequencies can be output to the clock:

- 19.5 kHz/39.1 kHz/78.1 kHz/156 kHz/313 kHz/625 kHz (with main system clock: 5.0 MHz)
- 32.768 kHz (with subsystem clock: 32.768 kHz)

5.6 A/D CONVERTER

An 8-bit resolution 8-channel A/D converter is provided.

This A/D converter can be started in the following two modes:

- Hardware start
- Software start

Fig. 5-9 A/D Converter Block Diagram

5.7 SERIAL INTERFACE

Two channels of clocked serial interfaces are provided.

- Serial interface channel 0
- Serial interface channel 1

5.8 FIP CONTROLLER/DRIVER

An FIP controller/driver having the following features is provided:

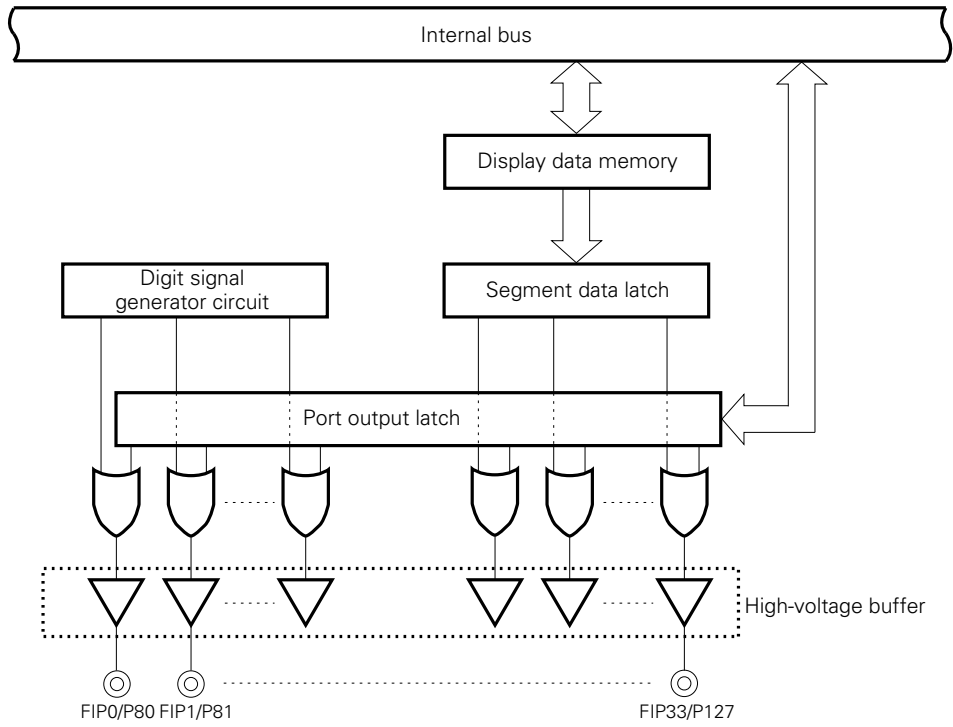

- (a) Automatic output of segment signals (DMA operation) and digit signals by automatically reading display data
- (b) Display mode registers (DSPM0 and DSPM1) that can control an FIP of 9 to 24 segments and 2 to 16 digits
- (c) Port pins not used for FIP display can be used as output port or I/O port pins.
- (d) Display mode register (DSPM1) can adjust luminance in eight steps.
- (e) Hardware suitable for key scan application using segment pins
- (f) High-voltage output buffer (FIP driver) that can directly drive an FIP

6. INTERRUPT FUNCTION AND TEST FUNCTION

6.1 INTERRUPT FUNCTION

The following three types of interrupt functions are available:

- Non-maskable interrupt : 1
- Maskable interrupt : 13
- Software interrupt : 1

Table 6-1 Interrupt Source List

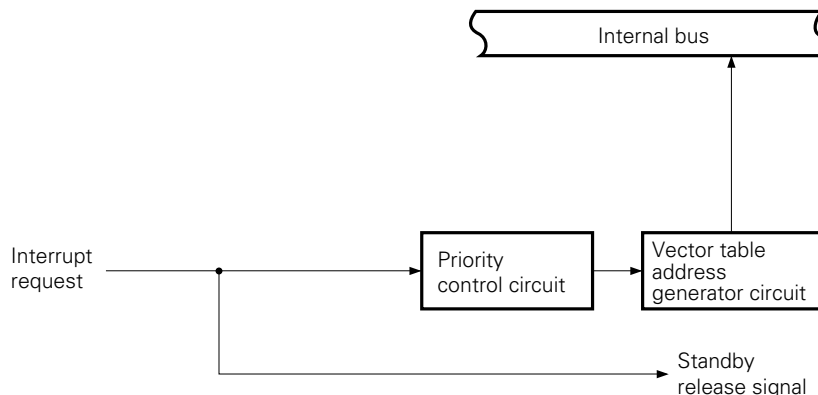

Interrupt type	Note 1 Default priority	Interrupt source		Internal/external	Vector table address	Note 2 Basic configuration type			
		Name	Trigger						
Non-maskable	—	INTWDT	Watchdog timer overflow (with watchdog timer mode 1 selected)	Internal	0004H	(A)			
Maskable	0	INTWDT	Watchdog timer overflow (with interval timer mode selected)			External	0006H	(B)	
	1	INTP0	Pin input edge detection	External	0008H			(D)	
	2	INTP1							
	3	INTP2							
	4	INTP3							
		INTUD	Up/down counter match signal generation	Internal	000CH			(B)	
	5	INTCSI0	End of serial interface channel 0 transfer	Internal	000EH			(B)	
	6	INTCSI1	End of serial interface channel 1 transfer						
	7	INTTM3	Reference time interval signal from watch timer						
	8	INTTM0	16-bit timer/event counter match signal generation						
	9	INTTM1	8-bit timer/event counter 1 match signal generation						
	10	INTTM2	8-bit timer/event counter 2 match signal generation						
	11	INTAD	End of A/D converter conversion						
12	INTKS	Key scan timing from FIP controller/driver							
Software	—	BRK	Execution of BRK instruction			Internal	003EH		(E)

Notes 1. Default priority is the priority order when several maskable interrupts are generated at the same time. 0 is the highest order and the 12 is the lowest order.

2. Basic configuration types (A) to (E) correspond to (A) to (E) in Fig. 6-1.

7. STANDBY FUNCTION

The standby function is to reduce the current dissipation of the system and can be effected in the following two modes:

- HALT mode: In this mode, the operating clock of the CPU is stopped. By using this mode in combination with the normal operation mode, the system can be operated intermittently, so that the average current dissipation can be reduced.
- STOP mode: Oscillation of the main system clock is stopped. All the operations on the main system clock are stopped, and therefore, the current dissipation of the system can be minimized with only the subsystem clock oscillating.

Fig. 7-1 Standby Function

Note By stopping the main system clock, the current dissipation can be reduced. When the CPU operates on the subsystem clock, stop the main system clock by setting the MCC. The STOP instruction cannot be used.

Caution When the main system clock is stopped and the subsystem clock is operating, to switch again from the subsystem clock to the main system clock, allow sufficient time for the oscillation to settle before switching, by coding the program accordingly.

8. RESET FUNCTION

The system can be reset in the following two modes:

- External reset by $\overline{\text{RESET}}$ pin
- Internal reset by watchdog timer that detects hang up

Total power dissipation	P _T ^{Note 3}	T _A = -40 to +60 °C		800	mW
				600	mW
Operating ambient temperature	T _A			-40 to +85	°C
Storage temperature	T _{stg}			-65 to +150	°C

Caution Exposure to Absolute Maximum Ratings for extended periods may affect device reliability; exceeding the ratings could cause permanent damage. The parameters apply independently. The device should be operated within the limits specified under DC and AC Characteristics.

Remark Unless otherwise specified, the characteristics of a shared pin are the same as those of a port pin.

Notes 1. For pins to which pull-up resistors are connected by the mask option, the rating is -0.3 to V_{DD} + 0.3.

2. To obtain the rms value, calculate [rms value] = [peak value] × "duty".

Notes 3. Permissible total power dissipation differs depending on the temperature (see the following figure).

How to calculate total power dissipation

The following three power dissipation are available for the μPD78042A, μPD78043A, μPD78044A and μPD78045A. The sum of the three power dissipation should be less than the total power dissipation Pr (80 % or less of ratings is recommended).

- # CPU power dissipation: calculate $V_{DD} (MAX.) \times I_{DD1} (MAX.)$.
- \$ Output pin power dissipation: Normal output and display output are available. Power dissipation when maximum current flows into each output pin is added.
- % Pull-down resistor power dissipation: Power dissipation by pull-down resistor connected to display output pin by the mask option.

Example 9 segments × 11 digits, 4LED outputs, $V_{DD} = 5 V \pm 10 \%$, 5.0 MHz oscillation
 13 mA (MAX.) flows into segment pin and timing pin. 10 mA (MAX.) flows into LED output pin. The voltage of the FIP (voltage of V_{LOAD}) is -30 V.
 Other output power dissipation is considered to be small.

- # CPU power dissipation : $5.5 V \times 21.6 mA = 118.8 mW$
- \$ Pin power dissipation : Segment pin $2 V \times 13 mA \times 9 lines = 234 mW$
 Timing pin $2 V \times 13 mA = 26 mW$
 LED output $\left[\frac{10}{15} \times 2 V \right] \times 10 mA \times 4 lines = 53.3 mW$
- % Pull-down resistor power dissipation: $\left[\frac{(30 + 5.5 V)^2}{25 k\Omega} \right] \times 7 lines = 352.9 mW$

The total power dissipation = # + \$ + % = 785 mW (< $P_T = 800 mW$)

In this example, if the temperature range is $T_A = -40 \text{ °C}$ to $+60 \text{ °C}$, the permissible total power dissipation is 800 mW from the graph above, so there is no problem in power dissipation of 785 mW. However, when the total power dissipation exceeds the rating of the permissible total power dissipation, it is necessary to lower the power dissipation. Lowering the power dissipation can be realized by reducing the number of internal pull-down resistors.

MAIN SYSTEM CLOCK OSCILLATOR CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = 2.7$ to 6.0 V)

Resonator	Recommended circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Ceramic resonator		Oscillation frequency (f_x) ^{Note 1}		1		5	MHz
		Oscillation stabilization time ^{Note 2}				4	ms
Crystal resonator		Oscillation frequency (f_x) ^{Note 1}		1	4.19	5	MHz
		Oscillation stabilization time ^{Note 2}	$V_{DD} = 4.5$ to 6.0 V			10 30	ms
External clock		X1 input frequency (f_x) ^{Note 1}		1		5	MHz
		X1 input high, low-level width (t_{xH} , t_{xL})		100		500	ns

Notes 1. It indicates only the oscillator characteristics. For the instruction execution time, see the AC Characteristics.

2. Time required until oscillation becomes stable after V_{DD} is applied or the STOP mode is disabled.

Cautions 1. If the main system clock oscillator is to be used, wire the area inside the broken line square as follows to avoid influence of wiring capacitance:

- Make wiring as short as possible.
- Do not cross other signal lines.
- Do not get close to lines with fluctuating large current.
- Make sure that the connecting points of the capacitor of the oscillator always have the same electric potential as V_{SS} .
- Do not connect the oscillator to a ground pattern that conducts a large current.
- Do not take out signal from the oscillator.

2. When switching to the main system clock again after the subsystem clock has been used with the main system clock stopped, be sure to set the program to provide enough time for the oscillation to stabilize.

SUBSYSTEM CLOCK OSCILLATOR CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = 2.7$ to 6.0 V)

Resonator	Recommended circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f_{XT}) ^{Note 1}		32	32.768	35	kHz
		Oscillation stabilization time ^{Note 2}	$V_{DD} = 4.5$ to 6.0 V		1.2	2	s
External clock		XT1 input frequency (f_{XT}) ^{Note 1}		32		50	kHz
		XT1 input high, low-level width (t_{XTH} , t_{XTL})		10		15	μs

Notes 1. It indicates only the oscillator characteristics. For the instruction execution time, see the AC Characteristics.

2. Time required until oscillation becomes stable after V_{DD} reaching MIN. of oscillation voltage range.

Cautions 1. If the subsystem clock oscillator is to be used, wire the area inside the broken line square as follows to avoid influence of wiring capacitance:

- Make wiring as short as possible.
- Do not cross other signal lines.
- Do not get close to lines with fluctuating large current.
- Make sure that the connecting points of the capacitor of the oscillator always have the same electric potential as V_{SS} .
- Do not connect the oscillator to a ground pattern that conducts a large current.
- Do not take out signal from the oscillator.

2. The subsystem clock oscillator is more likely to have malfunctions due to noise than the main system clock oscillator because gain for the subsystem clock oscillator is made lower to reduce current consumption. When using the subsystem clock, be careful about how to connect wires.

12. RECOMMENDED SOLDERING CONDITIONS

The conditions listed below shall be met when soldering the μPD78042A, μPD78043A, μPD78044A, μPD78045A.

For details of the recommended soldering conditions, refer to our document SMD Surface Mount Technology Manual (IEI-1207).

Please consult with our sales offices in case any other soldering process is used, or in case soldering is done under different conditions.

Cautions on CMOS Devices

Countermeasures against static electricity for all MOSs

Caution When handling MOS devices, take care so that they are not electrostatically charged.

Strong static electricity may cause dielectric breakdown in gates. When transporting or storing MOS devices, use conductive trays, magazine cases, shock absorbers, or metal cases that NEC uses for packaging and shipping. Be sure to ground MOS devices during assembling. Do not allow MOS devices to stand on plastic plates or do not touch pins. Also handle boards on which MOS devices are mounted in the same way.

\$ CMOS-specific handling of unused input pins

Caution Hold CMOS devices at a fixed input level.

Unlike bipolar or NMOS devices, if a CMOS device is operated with no input, an intermediate-level input may be caused by noise. This allows current to flow in the CMOS device, resulting in a malfunction. Use a pull-up or pull-down resistor to hold a fixed input level. Since unused pins may function as output pins at unexpected times, each unused pin should be separately connected to the V_{DD} or GND pin through a resistor. If handling of unused pins is documented, follow the instructions in the document.

% Statuses of all MOS devices at initialization

Caution The initial status of a MOS device is unpredictable when power is turned on.

Since characteristics of a MOS device are determined by the amount of ions implanted in molecules, the initial status cannot be determined in the manufacture process. NEC has no responsibility for the output statuses of pins, input and output settings, and the contents of registers at power on. However, NEC assures operation after reset and items for mode setting if they are defined.

When you turn on a device having a reset function, be sure to reset the device first.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customer must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices in "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact NEC Sales Representative in advance.

Anti-radioactive design is not implemented in this product.
